Trolling Weight Spezial

When trolling, the lead's weight and the conditions such as the size of the bait, trolling speed and the depth of the water must be perfectly factored together. This requires a rapid adjustment of the weight. We have the perfect solution. The special shape of the trolling weight, almost totally eliminates line torsion.

Here is how it is done:

A loop in the line is fed from BEHIND through the metal bracket – position the line on top of the bracket – and with a short pull, the line snaps into the grommets. In order to change it, reverse the process – it only takes seconds to accomplish.
