

Dega Centron Fluorocarbon Trace line 30m

Jenzi

Product number: 3428-CF

improved Premium quality

from 15,99 €* 15,99 €

Trace and Rig Lines are usually spooled on small coils. The result is distortion and due to the low coil core, an increased "memory effect". In high-performance lines these strains have fatal consequences: The cords drop sharply in capacity. Their distortions cause significant twisting effect of the copolymer with the result of the formation of unpleasant wigs Leaders. DEGA finally makes the breakthrough: The coil core is above average.

Centron fluorocarbon is invisible because light refraction factor is almost identical to the water. Fluorocarbon is also heavier than water and sinks faster than traditional monofilament lines. It does not drive as fast, thus smaller string loops in the water right away and safe, even over long distances.
